Anti-islanding of photovoltaic inverters

Overview

Anti-islanding protection is a commonly required safety feature which disables PV inverters when the grid enters an islanded condition. Anti-islanding protection is required for UL1741 / IEEE 1547. How does a photovoltaic inverter prevent islanding?

The performance in islanding prevention is determined by the detection time of islanding operation mode. The proposed anti-islanding protection was simulated under complete disconnection of the photovoltaic inverter from the electrical power system, as well as under grid faults as required by new grid codes.

1. Introduction.

What causes a PV inverter to Island?

Motivation and incitement Islanding for PV systems appears when the utility grid is disconnected and the PV inverter continues to operate with local loads during the utility outage . . The islanding operation can be unintentional or intentional , , .

How to detect islanding in a PV inverter?

Standard low-cost methods for islanding detection, such as OUV and OUF protection relays protect the consumers equipment and serve as passive inverter-resident anti-islanding methods , . These methods can be software procedures implemented in the PV inverter.

When does a PV inverter Island?

Islanding for PV systems appears when the utility grid is disconnected and the PV inverter continues to operate with local loads during the utility outage , . The islanding operation can be unintentional or intentional , , . An intentional islanding operation is planned whereas an unintentional islanding operation is unplanned .

What are grid-connected PV inverters?

Grid-connected PV inverters are electronic devices that convert DC power from photovoltaic (PV) solar panels into AC power that can be fed into the utility grid. They are required to have passive anti-islanding protection methods. These methods cause the PV inverter to stop supplying power to the utility grid if the voltage amplitude or the frequency of the point of common coupling (PCC) between the local customer load and the utility grid strays outside of prescribed limits.

Does a passive anti-islanding strategy reduce the voltage stress of photovoltaic inverters?

This paper proposes a new passive anti-islanding strategy for photovoltaic systems. The proposed strategy reduces the voltage stress of photovoltaic inverters. The performance of the proposed strategy in fault ride-through operation is proved.
