

# **Base station layout design for communication**

## Overview

---

In this chapter, the base station (BS) design and siting method is introduced, which includes three parts: general BS design and siting method, stochastic geometry in BS design and siting, frequency planning for BS design and siting. What is traditional base station architecture?

Traditional base station architecture refers to the conventional setup of telecommunications infrastructure before the emergence of modern technologies like Active Antenna Units (AAUs) and Software-Defined Networking (SDN).

What is the principle of base station design and siting?

The principle of base station design and siting is given as follows: Estimate the amount of base stations by means of link budget and coverage requirement. Analyze the capacity of actual network and then determine the required amount of base stations which can meet the need of capacity.

What ancillary equipment does a base station need?

In addition to the antenna, radio unit, and BBU, traditional base stations typically include various ancillary equipment such as power supplies, cooling systems, and physical infrastructure for housing and protecting the components. The advent of Active Antenna Units (AAUs) marked a paradigm shift in base station architecture.

What is a base station antenna?

At the heart of every base station is the antenna, which serves as the interface between the radio frequency signals and the surrounding environment. Antennas are responsible for transmitting and receiving electromagnetic waves to and from mobile devices within their coverage area.

What does a baseband processing unit do?

The baseband processing unit handles the digital signal processing tasks within the base station. It is responsible for tasks such as encoding and decoding data, modulation and demodulation of signals, channel coding, error correction, and various other functions necessary for communication.

What is the general BS design and siting method?

In this chapter, the general BS design and siting method is introduced, which gives the general process of BS planning and the estimation method of BS number. Then, the basic theory about stochastic geometry is introduced in BS design and siting, respectively Poisson point process and Voronoi tessellation.
