## Overview

How do batteries make money in power markets?

Batteries make money in power markets through arbitraging the value between charging and discharging power. The greater the difference between high and low power prices across the day, the larger the profit for a battery asset.

What is a battery energy storage project?

A battery energy storage project is a system that serves a variety of purposes for utilities and other consumers of electricity, including backup power, frequency regulation, and balancing electricity supply with demand.

What is the 'value stack' in energy storage?

Owners of batteries, including storage facilities that are co-located with solar or wind projects, derive revenue under multiple contracts and generate multiple layers of revenue or 'value stack.' Developers then seek financing based on anticipated cash flows from all or a portion of the components of this value stack.

Can a project owner sell a battery?

Under many of these contracts, the project owner retains operational control of the storage facility and the right to collect and retain revenue from sales of electricity discharged from the battery. The project may be able to sell electricity to the same buyer of the resource adequacy attributes or to another buyer in the market.

How will Price Spreads affect battery storage?

Cannibalisation of price spreads from other battery storage assets presents a significant risk, particularly in the BM which has smaller overall volumes. In addition, the entry of competing sources of flexibility, such as interconnection and Demand Side Response (DSR), will also dampen spreads and reduce the

opportunities for batteries.

Is the DC battery market a good investment?

Currently, the DC market is an overwhelmingly attractive proposition for battery assets, and a large contribution to the current appetite for storage deployment. However, these outsized returns should be taken with a pinch of salt.
