# Caracas Multifunctional Communication Base Station Supercapacitor Consultation

## Overview

---

What is multi-antenna multi-functional base station?

This system consists of a multi-antenna multi-functional base station (BS), an edge server, a target, and multiple single-antenna communication users. The BS needs to allocate the available resources to efficiently provide sensing, communication, and computation services.

How does BS facilitate ISCAP?

To facilitate ISCAP, the BS employs the joint transmit beamforming design by sending dedicated sensing/energy beams jointly with information beams. Furthermore, we consider the beam scanning for sensing, in which the joint beams scan in different directions over time to sense potential targets.

Which Supercapacitors can be used for a broader application range?

A broader application range would also be possible with low temperature low ESR supercapacitors (e.g. for deep space missions) or with high temperature long-term stable supercapacitors (for memory and clock backup). The TRL of the developed BOSC can be considered to be 6.

How many antennas does a multi-function bs have?

The multi-function BS is equipped with  $M_t = 16$  transmit antennas and  $M_r = 20$  receive antennas. The distance-dependent path loss for communication links is modeled as  $PL(d) = p_0(d/d_0)^{-\alpha}$ , where  $p_0$  corresponds to the path loss at the reference distance  $d_0 = 1$  m and is given as  $p_0 = -30$  dB . Besides,
