

## SolarGrid Energy Solutions

# Green communication base station built on North Korean plateau

## Overview

---

How many 5G base stations does South Korea have?

In the report, South Korea ranked first among 29 countries, including non-OECD members such as China and the European Union, in “5G base station deployment.” The country recorded 593 5G base stations per 100,000 inhabitants, significantly surpassing Lithuania (328) and Finland (251).

Are green cellular base stations sustainable?

This study presents an overview of sustainable and green cellular base stations (BSs), which account for most of the energy consumed in cellular networks. We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

What is a green base station solution?

The green base station solution involves base station system architecture, base station form, power saving technologies, and application of green technologies. Using SDR-based architecture and distributed base stations is a different approach to traditional multiband multimode network construction.

Why is a base station important?

Environmental protection is a global concern, and for telecom operators and equipment vendors worldwide, developing green, energy-saving technologies for wireless communications is a priority. A base station is an important element of a wireless communications network and often the main focus of power saving in the whole network.

How ACS cooled a base station can save energy?

Compared with a traditional equipment room, an ACS-cooled room can save up to 70% energy. A sharp decrease in power consumption in a base station makes it possible to replace the traditional electrical power supply with solar

or wind energy. Among other solutions, solar and hybrid solar-wind power has gradually been applied in base stations.

What should a base station do in a wireless communications network?

In a wireless communications network, the base station should maintain high-quality coverage. It should also have the potential for upgrade or evolution. As network traffic increases, power consumption increases proportionally to the number of base stations. However, reducing the number of base stations may degrade network quality.
