High frequency square wave of inverter

Overview

What is a high frequency inverter?

In many applications, it is important for an inverter to be lightweight and of a relatively small size. This can be achieved by using a High-Frequency Inverter that involves an isolated DC-DC stage (Voltage Fed Push-Pull/Full Bridge) and the DC-AC section, which provides the AC output.

Can HF square wave voltage be reconstructed?

It can be seen from the figure that when the frequency of injected HF square-wave voltage is half of PWM frequency, by adopting the HF square-wave voltage time-division injection method proposed in Section 4, not only the fundamental current, but also the HF current can be reconstructed.

Can HF square-wave voltage injection be used for phase current reconstruction?

The proposed method for the first time applies the HF square-wave voltage injection sensorless control method to the ZVVSM for phase currents reconstruction with an SCS, and solves the problem that the ZVVSM cannot accurately reconstruct the HF response current caused by HF square-wave voltage injection.

What is HF square-wave voltage injection?

The injection of HF square-wave voltage results three-phase currents containing both fundamental and HF components. Current reconstruction not only needs to reconstruct the three-phase fundamental currents to achieve stable control of the motor, but also needs to reconstruct the HF response current to implement the rotor position estimation.

What is a high frequency square wave signal injection Sensorless control algorithm?

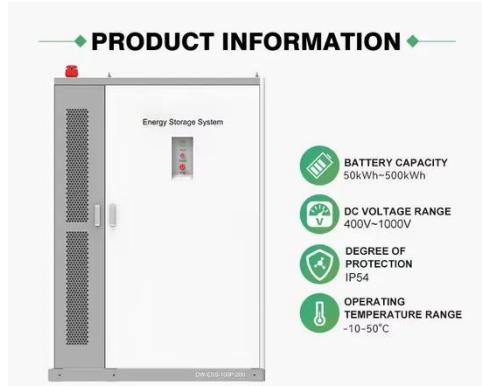

To the traditional high-frequency square wave signal injection sensorless

control algorithm, the frequency of the injected square wave signal is generally equal to 1/2 of the PWM cycle frequency.

What is the injected square wave signal frequency?

From Figure 3, to the traditional high-frequency square wave signal injection sensorless control method, the injected square wave signal frequency is 1/2 of the carrier wave.
