# How many kilowatts does a large container generator have

## Overview

---

Marine generators are available in sizes from: 100–200 kW (typical for small vessels or standby purposes) Up to 5–6 MW (used on large tankers, container ships, or cruise ships) What size generator container do I Need?

Our generator containers for Type 2, 3, and 4 gas engines have a standard 40-foot length. Width and height depend on engine type, the application (power generation only or CHP) and ambient conditions. Customized sizes to accommodate special project requirements are available on request.

How much power does a generator need?

In general, 1500–3000 kW of power is required, regardless of the mode. Accordingly, it seems appropriate to select the capacity that can operate the generator most efficiently in the 1500–3000 kW range. In addition, when using a heavy consumer, the peak load increases; therefore, the stability of the power supply must be ensured.

What size generator do I Need?

If you have minimal power requirements, you may only need a small diesel generator. These are available in a range of sizes from 2 kVA to around 40 kVA and include: Inverter generators are generally small and portable.

What is a type 6 generator container?

Our Type 6 generator containers consist of two or three pre-assembled modules, depending on the engine type and the application. The overall package (gas engine, container, and auxiliary components) is available for 65, 70, 75 and 80 dB (A) in 10m (surface sound pressure level according to DIN 45635).

How to calculate generator capacity?

First, to calculate the generator capacity, the characteristics of each operation mode were analyzed through the actual load profile data of the ship. The time

ratio and power demand range for each operation mode were confirmed as quartiles of the power data for each operation mode.

Do ships need a generator based power system?

In general, ships' operations require power lower than the installed generator capacity. However, when the generator is operated at a low load, its efficiency decreases. In this study, based on actual operation data, the load requirements for each operation mode were analyzed, and a diesel-generator-based power system was designed.
