Can a PV system be installed on a flat roof?

Designing and installing a PV system on a flat roof requires careful planning and the adoption of innovative solutions to ensure optimal performance and durability. By using high-quality materials, such as GB Solar's precast concrete PV ballasts, and following best engineering practices, a safe, stable, and efficient PV system can be built.

How to install solar panels on a flat roof?

Solar panels that are mounted onto flat roofs need to be installed at a pitch that captures as much sunlight as possible, as well as keeping the panel clean. By mounting the panels at an angle of at least 10 degrees, self-cleaning is possible. Thankfully, self-standing solar panels are usually fitted at 20 and 50-degree angles.

Why should you choose a flat roof for your PV system?

In addition, flat roofs allow for greater flexibility in panel arrangement, enabling optimization of orientation and tilt to maximize sunlight absorption. The choice of materials and support structures is crucial to ensure the stability and durability of your PV system.

Do solar panels take up more space on a flat roof?

Flat roof systems take up more space per kW than on-roof photovoltaic systems. This is because, there must be a separation between rows of the PV panels, in order to prevent one row from shading another. Installing Solar Panels on a flat roof is dependant on your roof structure, as it must be able to handle the additional weight.

What is the difference between on-roof solar and flat roof solar?

Whereas on-roof Solar PV systems follow the pitch of the existing roof, flat roof systems require the installer to set their own pitch. This is great, as it means

that your system can be designed for optimal solar generation. The ideal pitch for a Solar Panel is around 30 degrees off the horizontal.

Why should you choose a flat roof solar system?

Flat roofs provide easy access and plenty of room for installation and maintenance. Flat roof systems take up more space per kW than on-roof photovoltaic systems. This is because, there must be a separation between rows of the PV panels, in order to prevent one row from shading another.
