

# **Outdoor power supply lithium iron phosphate temperature control**

## Overview

---

Does lithium iron phosphate affect low-temperature discharge performance?

In this paper, according to the dynamic characteristics of charge and discharge of lithium-ion battery system, the structure of lithium iron phosphate is adjusted, and the nano-size has a significant impact on the low-temperature discharge performance.

Can lithium iron phosphate batteries discharge at 60°C?

Compared with the research results of lithium iron phosphate in the past 3 years, it is found that this technological innovation has obvious advantages, lithium iron phosphate batteries can discharge at  $-60^{\circ}\text{C}$ , and low temperature discharge capacity is higher. Table 5. Comparison of low temperature discharge capacity of LiFePO<sub>4</sub> / C samples.

What are lithium iron phosphate batteries?

1. Introduction Lithium iron phosphate batteries (LIBs) have been widely used for their long service life, high energy density, environmental friendliness, and effective integration of renewable resources , , , , , .

How to improve the conductivity of lithium iron phosphate materials?

The most effective method to improve the conductivity of lithium iron phosphate materials is carbon coating . LiFePO<sub>4</sub> nanitization , , can also improve low temperature performance by reducing impedance by shortening the lithium ion diffusion path. The increase of electrode electrolyte interface increases the risk of side reaction.

Why is lithium iron phosphate a bad battery?

Lithium iron phosphate battery works harder and lose the vast majority of energy and capacity at the temperature below  $-20^{\circ}\text{C}$ , because electron transfer resistance (R<sub>ct</sub>) increases at low-temperature lithium-ion batteries, and lithium-ion batteries can hardly charge at  $-10^{\circ}\text{C}$ . Serious performance

attenuation limits its application in cold environments.

How to improve electrical conductivity of lithium ion at low temperature?

In this paper, the electrical conductivity of the material was improved by controlling the nano-structure of lithium iron phosphate, and the concentration deviation of lithium ion at low temperature was equalized by adding LATP in high concentration lithium salt and positive electrode.
