The role of container cooling generator

Overview

Do refrigerated containers have generators?

Some refrigerated containers feature built-in generators. These allow for independent power generation during transit or in areas without external power access. Operators can use diesel generators in remote locations or when stationary power is unavailable. These portable units provide energy to keep the cooling system running.

How does a reefer container genset work?

However, when a reefer container is transported, the generator set is not able to draw power through an electrical socket. Therefore, it requires an external power source, which is fuel (typically gas, diesel, or petrol). Due to the different modes of transport that a reefer container is moved by, there are various types of gensets.

Why should you choose a container genset?

Portability: Container gensets can be easily attached and removed, allowing for seamless integration into various transport modes. Reliability: Designed for continuous operation, they ensure an uninterrupted power supply for reefers.

What is a container genset?

Container gensets mitigate this risk by providing a consistent power supply, even in remote or challenging locations. For example, frozen shipping containers rely heavily on these gensets to maintain ultra-low temperatures during transit.

Do reefer containers need gensets?

Clip-on gensets are a good option if multiple reefer containers are transported via sea, road, or rail, where an electrical power grid or an undermount genset is not available. Certain warehouses or facilities are not set up with “reefer plugs”.

What type of generator is used for refrigerated shipping containers?

- Diesel generators: Diesel generators are the most common type of generator used for refrigerated shipping containers. They are reliable, durable, and can provide a lot of power. However, diesel generators can be noisy and expensive to operate.
