## Overview

What is an uninterruptible power supply (UPS)?

An Uninterruptible Power Supply (UPS) is defined as a piece of electrical equipment which can be used as an immediate power source to the connected load when there is a failure in the main input power source. In a UPS, the energy is generally stored in flywheels, batteries, or super capacitors.

Do uninterruptible power supplies need protection?

Yes, uninterruptible power supplies must work when needed. Even in the most challenging of conditions, robust protection of the PCB and electrical components will help safeguard UPS functionality. LOCTITE® and TECHNOMELT® brand circuit board protection materials deliver critical defense again.

What problems can be corrected in an UPS system?

The problems that can be corrected are voltage spike (sustained over voltage), Noise, Quick reduction in input voltage, Harmonic distortion and the instability of frequency in mains. Generally, the UPS system is categorised into On-line UPS, Off-line UPS and Line interactive UPS.

How does a UPS system work during a power breakdown?

Once the power is restored, the rectifier begins to charge the batteries. To prevent the batteries from overheating due to the high power rectifier, the charging current is limited. During a main power breakdown, this UPS system operates with zero transfer time.
