# Will the power of energy storage batteries expire

## Overview

---

### How long does a battery last?

There are two primary factors that determine how long a battery, disposable or rechargeable, will last in the long run: self-discharge and shelf life. Self-discharge refers to how much of a battery's stored energy is escaping from it on a regular basis.

### What happens when a battery expires?

As the battery nears the end of its shelf life, it becomes less capable of holding a charge, to the point that it won't be able to deliver power even if you've never used it before. Much like the bag of chips in your pantry, all batteries are stamped with an expiration date. Unlike those chips, though, battery expiration works slightly differently.

### What is the shelf life of a battery?

Basically, shelf life is the time limit for how long you can leave a battery in storage and still use it in a device. The breakdown of components can also increase the likelihood of battery acid leaks and corrosion, which can damage your electronics if you leave old batteries in them long-term.

### Can a battery be recharged if it's expired?

Even if the battery in question can be recharged, it doesn't matter. Putting more energy in an expired battery is kind of like pouring water into a bucket full of holes; it might hold it for a moment, but it'll all leak out before you can do anything with it.

### What happens to battery energy at the end of life?

The battery energy at the end-of-life depends greatly on the energy status at the as-assembled states, material utilization, and energy efficiency. Some of the battery chemistries still can have a significant amount of energy at the final life cycle, and special care is needed to transfer, dispose of, and recycle

these batteries.

Does a battery lose energy if a program is not consuming energy?

In other words, even when the linked program is not consuming any energy, the battery, nevertheless, loses energy. The outside temperature, the battery's level of charge, the battery's design, the charging current, as well as other variables, can all affect how quickly a battery discharges itself [231, 232].
